

Module 4: Pandas Challenge

Summary

There are 15 school in total which are selected for the analysis. The total budget for these schools is \$24,649,428. There are two types of schools i.e. District and Charter. The top 5 majority schools performing well are charter, whereas the bottom 5 not performing well are district level schools. Henceforth, the majority of budget should be spent on the Charter level schools for improved progress.

Since the number of students are less in the charter schools, the education quality and management of the students would be much efficient in comparison to district level school. Whereas in district level schools, the number of students is higher. Henceforth, it is likely impossible to focus on each student's support.
